

STOP AQUATIC HITCHHIKERS!

Aquatic Invasive Species (AIS), such as Eurasian watermilfoil, Asian clams, and zebra mussels, can be spread between waterbodies on boating and fishing equipment that has not been cleaned, drained, and dried. Help protect Lake George by following these guidelines.

CLEAN

AFTER BOATING, BEFORE YOU LEAVE THE LAUNCH:

Remove all visible plants, animals, fish, and mud from your boat, trailer, or other equipment and dispose of in a suitable trash container or on dry land.

Don't transport any potential hitchhiker, even back to your home. Remove and leave them at the site you visited.

DRAIN

AFTER BOATING, BEFORE YOU LEAVE THE LAUNCH:

Drain water from bilge, live wells, ballast tanks, and any other locations with water before leaving the launch.

Invasive viruses, zooplankton, and juvenile zebra mussels and Asian clams can be transported in even just a drop of water!

DRY

BEFORE YOU ARRIVE AT THE LAUNCH TO GO BOATING:

Dry your boat, trailer, and all equipment completely. Drying times vary depending on the weather and the type of material. **At least five days of drying time is generally recommended during the summer.**

If you want to use your boat sooner, follow additional steps to make sure it is decontaminated from any hitchhikers. See the back side to find out how!

HELP STOP THE SPREAD OF AQUATIC INVASIVES!

Hydrilla

Zebra mussel

Spiny water flea

Eurasian watermilfoil

Asian clam

Alewife

Aquatic invasive species (AIS) are non-native plants and animals that threaten native plants, wildlife, and their habitat. They also affect humans by degrading boating and fishing areas and reducing lake shore property values and tourism. Once AIS are established, eradication is almost impossible and management programs are very expensive. Spread prevention is the most cost-effective option for protecting our lakes.

Lake George currently has six known AIS: Eurasian watermilfoil, curly-leaf pondweed, zebra mussels, Asian clam, Chinese mystery snail, and spiny water flea. There are many more AIS that have already invaded other lakes close by, such as alewife and hydrilla. Boats travel between these lakes and Lake George, creating pathways for AIS to spread.

Not all hitchhikers are as visible as a prop covered in adult zebra mussels. Some adult or juvenile stage AIS are so small they can't be seen without magnification. Invasive viruses, zooplankton, and recently hatched zebra mussels and Asian clams can be transported in mud,

on plant fragments, or in small amounts of water. When you exit a waterbody, check for anything visible while at the launch and remove it. Then wash your boat and equipment more thoroughly at a boat wash station, car wash, or back home.

Lake Steward Program data collected from 2008-2013 found that boats came from over 400 different waterbodies across the region to Lake George: 132 waterbodies in New York and 270 waterbodies in other states and Canada."

If your boat is not clean, drained, and dry - visit a boat decontamination station to have it cleaned with high pressure hot water .

Alternative Cleaning/Disinfecting Options

Dip gear that cannot withstand hot water into:

100% vinegar for 20 minutes

OR

1% table salt solution for 24 hours
 $\frac{2}{3}$ cup of salt mixed with 5 gallons of water

OR

2% bleach solution for 10 minutes
 3 oz. bleach mixed with 1 gallon of water

OR

Household cleaners such as Fantastik® or Formula 409®, (or any cleaner with the active ingredient alkyl dimethyl benzyl ammonium chloride) for 10 minutes.

Rinse with clean water after disinfecting.

Follow label instructions for all materials. Dispose of all cleaning solutions away from surface waters in accordance with label restrictions.
